Anaphylaxis Following Administration of Neptazol: A Case Report

Chen H, Alvarez M, Osei K.

J. Clin. Pharmacovigilance Reports, Vol 12(3), 2026

Abstract

We report a case of anaphylaxis in a 45-year-old man shortly after receiving Neptazol for hypertension management, highlighting the importance of prompt recognition and reporting.

Introduction

Adverse drug reactions remain an important area of post-marketing surveillance. We describe a case observed in clinical practice and discuss its implications.

Case Report

A 45-year-old man with no known drug allergies was prescribed Neptazol 20mg daily. Approximately 30 minutes after his first dose, he developed facial flushing, throat tightness, and difficulty breathing. He was treated with intramuscular epinephrine in the emergency department and recovered fully within several hours. Neptazol was discontinued and not rechallenged.

Discussion

This case underscores the need for vigilance with first-dose reactions to Neptazol. Clinicians should counsel patients on early warning signs of anaphylaxis.
