Severe Contact Dermatitis Linked to Cortivex Cream Use

Dubois A, Meyer L.

Dermatology Case Reviews, Vol 5(4), 2026

Abstract

We describe a case of severe contact dermatitis in a 60-year-old woman using Cortivex Cream for eczema, later linked to a manufacturing defect in the affected batch.

Introduction

Adverse drug reactions remain an important area of post-marketing surveillance. We describe a case observed in clinical practice and discuss its implications.

Case Report

A 60-year-old woman applied Cortivex Cream to a small patch of eczema on her forearm. Within a day she developed intense redness, swelling, and blistering extending beyond the application site. She discontinued use and the reaction resolved over 10 days with topical corticosteroid treatment. The product tube was later found to be from a batch subject to a quality recall.

Discussion

This case illustrates how a product quality defect can present clinically as a severe adverse reaction, reinforcing the value of batch-level traceability.
