Dizziness and Falls in Elderly Patients on Sedaprin: A Case Report

Okafor N, Bianchi G.

Geriatric Medicine Case Files, Vol 3(2), 2026

Abstract

We present a case of a 71-year-old woman who experienced dizziness and a fall shortly after starting Sedaprin, raising concerns about its use in elderly patients.

Introduction

Adverse drug reactions remain an important area of post-marketing surveillance. We describe a case observed in clinical practice and discuss its implications.

Case Report

A 71-year-old woman was started on Sedaprin 10mg nightly for sleep difficulty. Two days later she experienced dizziness upon standing and fell in her bathroom, sustaining a hip bruise. Sedaprin was discontinued and no further falls occurred over the following month.

Discussion

Orthostatic effects of Sedaprin may be underrecognized in older adults; lower starting doses may be warranted in this population.
