Gastrointestinal Intolerance to Glucoreg: A Case Report

Kim J, Haddad Y.

Diabetes Care Reports, Vol 19(6), 2026

Abstract

A case of persistent nausea and vomiting associated with Glucoreg in a middle-aged man is reported, with symptom resolution following dose adjustment.

Introduction

Adverse drug reactions remain an important area of post-marketing surveillance. We describe a case observed in clinical practice and discuss its implications.

Case Report

A 45-year-old man newly started on Glucoreg for type 2 diabetes reported nausea and vomiting beginning approximately one hour after his morning dose, recurring on multiple days. Symptoms were mild and did not require medical attention. Dose timing was adjusted to be taken with food, after which symptoms improved substantially.

Discussion

Mild GI intolerance to Glucoreg is a known but underreported issue; simple dosing adjustments may improve tolerability without discontinuation.
